

PULSE 

Cardiac arrest is more common than you think.

1

Every year, **350,000 Americans** experience a cardiac arrest event outside a hospital.

2

Proper CPR can raise the risk of survival by **2X-3X**.

3

However, only **40% receive bystander CPR**, and only **11% do it right**.

That's where PulseAI steps in.

We've built an AI-powered app that transforms any bystander into a confident lifesaver, providing real-time, vision-based CPR feedback, hands-free audio coaching, and intelligent performance logging, because every beat can save a life.

PulseAI modernizes the way we approach CPR

Real-Time Vision Feedback

- TensorFlow.js + MoveNet for live position detection.
- Tracks compression rate, depth, and hand placement.

Dual-Mode Experience

- Bystander Mode: Step-by-step audio-visual CPR guidance for untrained users.
- EMT Mode: Low-latency technical feedback for trained responders and field use.

Audio-First Intelligent Coaching

- Hands-free operation via ElevenLabs voice feedback.
- Includes toggleable metronome to maintain 100–120 BPM rhythm.

AI Instructor On-Demand

- Integrated Gemini + OpenAI chatbot answers CPR questions instantly (“What if I hear a rib crack?”).
- Text and voice looped seamlessly into the same voice interface.

CPR “Black Box” Logging

- Records time-series metrics (BPM, depth, placement) every second.
- Exports lightweight JSON for training review, medical/legal records, or ML datasets, without compromising privacy.

We have a short demo for you.

Remember, you too can save a life with PulseAI.
